There are several ways to reset a user's password in **Active Directory**.

**Method 1: Using Active Directory Users and Computers (ADUC)**

1. Open **Active Directory Users and Computers** (dsa.msc).
2. Navigate to the user account.
3. Right-click the user and select **Reset Password**.
4. Enter the new password and confirm it.
5. Select the desired options:
    - **User must change password at next logon** (recommended)
    - **Unlock the user's account** (if the account is locked)
6. Click **OK**.

---

**Method 2: Using PowerShell**

Reset a user's password:

```
Set-ADAccountPassword -Identity "jdoe" `
  -Reset `
  -NewPassword (ConvertTo-SecureString "NewP@ssw0rd123!" -AsPlainText -Force)
```

Require the user to change the password at the next logon:

```
Set-ADUser -Identity "jdoe" -ChangePasswordAtLogon $true
```

Unlock the account if it is locked:

```
Unlock-ADAccount -Identity "jdoe"
```

These commands require the **Active Directory PowerShell module** and appropriate administrative permissions.

---

**Method 3: Using Command Prompt (net user)**

For a domain user:

```
net user jdoe NewP@ssw0rd123! /domain
```

---

**Common Password Reset Issues**

- **Access denied**: Your account may not have permission to reset passwords.
- **Password complexity error**: The new password does not meet the domain's password policy.
- **Account locked**: Unlock the account after resetting the password if necessary.
- **Replication delay**: In environments with multiple domain controllers, changes may take a short time to replicate.

---

**Best Practices**

- Verify the user's identity before resetting a password.
- Use a temporary strong password that complies with the domain's password policy.
- Enable **User must change password at next logon** unless there's a specific reason not to.
- Unlock the account only if it was locked due to failed sign-in attempts.
- Avoid sharing passwords through insecure channels such as unencrypted email or chat.
