Security Basics – Antivirus, BitLocker, MFA, and Password Policy

Security is a critical part of IT support and system administration. Organizations use multiple security controls to protect devices, user accounts, and sensitive data.

---

1. Antivirus

An **Antivirus (AV)** is software that detects, blocks, and removes malicious software (malware) such as viruses, worms, trojans, ransomware, and spyware.

Purpose

- Protect computers from malware
- Detect suspicious activities
- Remove infected files
- Prevent unauthorized access
- Provide real-time protection

Common Antivirus Solutions

- **Microsoft Defender**
- **Symantec**
- **McAfee**
- **Trend Micro**
- **CrowdStrike**

Features

- Real-time protection
- Scheduled scanning
- Automatic updates
- Quarantine infected files
- Web protection
- Email protection

- Ransomware protection

Best Practices

- Keep virus definitions updated.
- Enable real-time protection.
- Run regular full-system scans.
- Do not disable antivirus without authorization.
- Investigate and remediate detected threats promptly.
