Windows User Accounts

A **User Account** in Windows is a profile that allows a person to access and use a computer with their own settings, files, and permissions.

Types of User Accounts

1. **Administrator Account**
    - Has full control over the computer.
    - Can install or uninstall software.
    - Can change system settings.
    - Can create, modify, or delete other user accounts.
2. **Standard User Account**
    - Can use installed applications.
    - Can change personal settings (such as desktop background).
    - Cannot install software or make system-wide changes without administrator permission.
3. **Guest Account** (disabled or unavailable by default in modern Windows)
    - Provides temporary access for visitors.
    - Has very limited permissions.
    - Cannot make significant changes to the computer.

Common User Account Tasks

- Create a new user account.
- Change an account password or PIN.
- Switch between user accounts.
- Change account type (Standard ↔ Administrator).
- Delete a user account.
- Manage sign-in options.

How to Open User Accounts

Method 1: Settings

1. Press **Windows + I**.
2. Go to **Accounts**.
3. Select **Your info**, **Family & other users**, or **Sign-in options**.

Method 2: Control Panel

1. Press **Windows + R**.
2. Type control and press **Enter**.
3. Click **User Accounts**.

Method 3: Run Command

1. Press **Windows + R**.
2. Type netplwiz and press **Enter**.
3. The **User Accounts** window opens, where you can manage users and configure automatic sign-in.

Why User Accounts Are Important

- Protect personal files and privacy.
- Control who can make changes to the computer.
- Allow multiple people to share the same PC with separate settings.
- Improve system security by limiting administrative access.
