Common Symptoms

- Computer does not turn on.
- Black screen after pressing the power button.
- Stuck on the manufacturer logo.
- "No bootable device found" error.
- Blue Screen of Death (BSOD) during startup.
- Automatic repair loop.
- Continuous restarting.

Troubleshooting Steps

1. Check the Power Supply

- Ensure the power cable is securely connected.
- Verify the power outlet is working.
- For laptops, connect the AC adapter and check the charging indicator.
- Remove external battery (if removable), reconnect power, and try again.

2. Disconnect External Devices

- Remove USB drives, external hard disks, printers, memory cards, and other peripherals.
- Restart the computer to check if one of the devices is preventing startup.

3. Perform a Hard Reset

1. Turn off the computer.
2. Disconnect the power adapter.
3. Remove the battery (if removable).
4. Press and hold the power button for 15–20 seconds.
5. Reconnect the battery and power adapter.
6. Turn on the computer.

4. Check BIOS/UEFI Settings

- Restart the computer and enter BIOS/UEFI (usually by pressing **F2**, **F10**, **F12**, **Esc**, or **Del**).
- Confirm the internal hard drive or SSD is detected.
- Verify the correct boot device is selected.
- Restore BIOS to default settings if necessary.

5. Run Startup Repair

If Windows does not start:

1. Boot into the Windows Recovery Environment.
2. Select **Troubleshoot** > **Advanced options** > **Startup Repair**.
3. Allow Windows to diagnose and repair startup problems.

6. Boot into Safe Mode

- Access the Windows Recovery Environment.
- Select **Startup Settings** > **Restart**.
- Press **4** or **F4** for Safe Mode.
- Remove recently installed drivers, updates, or software if the issue began afterward.

7. Check the Storage Drive

- Verify that the HDD or SSD is properly connected.
- If available, run built-in hardware diagnostics.
- Replace the drive if diagnostics report hardware failure.

8. Repair Boot Files

Using Command Prompt in Windows Recovery Environment, run:

bootrec /fixmbr

bootrec /fixboot

bootrec /scanos

bootrec /rebuildbcd

Restart the computer after the commands complete.

9. Restore the System

If startup issues began after a recent change:

1. Open **Windows Recovery Environment**.
2. Select **System Restore**.
3. Choose a restore point created before the problem occurred.
4. Complete the restoration process.

10. Reinstall the Operating System

If none of the above steps resolve the issue:

- Back up important data if possible.
- Reinstall Windows using installation media.
- Install the latest drivers and Windows updates after installation.

Prevention Tips

- Keep Windows and device drivers updated.
- Shut down the computer properly.
- Use antivirus software to protect against malware.
- Avoid interrupting Windows updates.
- Regularly back up important files.
- Monitor hard drive health and replace failing drives promptly.
